How to Govern AI

Even If It's Hard to Predict

Three case files. One pattern. A control plane instead of a ban.

KUNAL DAS · DEVELOPER ADVOCATE, CAST AI · KIMCHI.DEV

Kimchi
By CAST AI

Your data is already in the model.

Nobody in this room approved it.

18,033 TB

of enterprise data flowed into AI platforms in 2025. Up 93% YoY. ChatGPT alone: 2,021 TB.

39.7%

of what employees paste into AI tools is sensitive. It was 10.7% two years earlier.

77%

of employees paste company data into AI tools. 82% via personal accounts.

30% of sensitive exposures are source code. 87% occur through ChatGPT Free. Measured on live telemetry, not surveys.

SOURCE: Zscaler ThreatLabz 2026 · Cyberhaven 2026 · LayerX 2025 · Harmonic 2025

CASE 001 Samsung Semiconductor · 2023 · status: unrecoverable

Three leaks in twenty days.

Then a total ban.

DAY 1-20

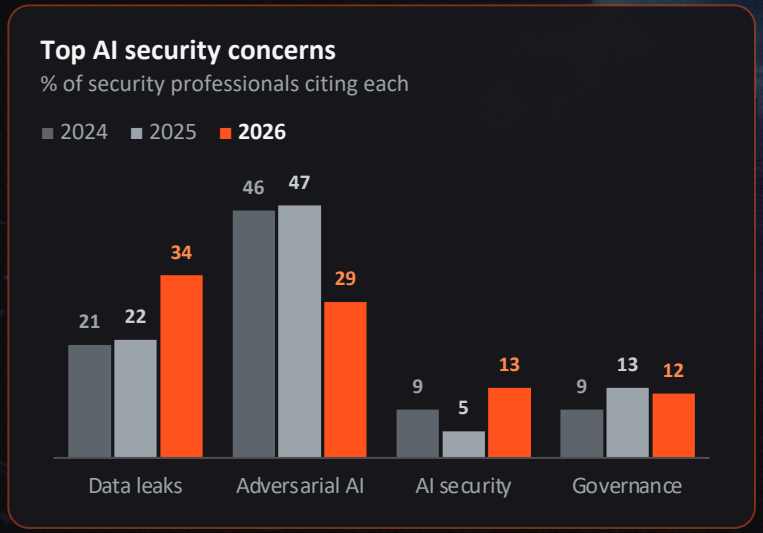

Engineer pastes buggy source code from a semiconductor database into ChatGPT for a fix. Confidential fab code, gone.

SAME WINDOW

A second employee uploads chip-testing code for "optimization." A third feeds a recorded meeting transcript for auto-minutes.

REACTION

Samsung caps prompts at 1,024 bytes, then bans generative AI on company devices. The data sits on servers they cannot control or delete.

SOURCE: The Economist Korea via PCMag (Apr 2023) · Bloomberg via The Hindu (May 2023)

CASE 002 Uber · 2026 · status: budget exhausted

Kimchi By CAST AI

5,000 engineers. Token leaderboards.

A full year of AI budget, gone by April.

32% → 84%

adoption in 30 days after leadership ranked teams by tokens burned.

$1,200

the CTO's token bill in a single two-hour demo. Average engineers ran $150-250 a month.

$1,500

the per-engineer monthly cap Uber now enforces per AI coding tool, after the blowout.

“Uber's COO on the spend: very hard to draw a line between token consumption and a single improvement customers noticed.”

SOURCE: The Information (Apr 2026) · LA Times / Bloomberg (Jun 2026) · VentureBeat (Sep 2026)

CASE 003 Microsoft, Experiences & Devices · 2026 · status: licenses cancelled

Kimchi By CAST AI

The company that knows AI costs best looked at its own invoice, and blinked.

DEC 2025	Microsoft gives thousands of its own engineers Claude Code. It becomes the preferred tool across Windows, Office, Surface teams.
JUN 2026	Most licenses cancelled. Engineers told to move to Copilot CLI by June 30. Official story: toolchain consolidation.
THE TELL	June 30 is the last day of Microsoft's fiscal year. Reporting on the internal memo: the decision was also a financial one.

> THE PATTERN ACROSS ALL THREE

Every response was restriction

- ✕ **Samsung:** 1,024-byte prompt caps, then a ban
- ✕ **Uber:** $1,500 monthly caps per tool
- ✕ **Microsoft:** licenses pulled at fiscal year end

SOURCE: LayerX 2025 · Cyberhaven 2026

WHAT RESTRICTION BUYS 01

Slower teams. The same exposure. The data that already left does not come back, and the next paste happens on a personal phone.

THE BLIND SPOT 02

DLP watches files, email, USB. AI exfiltration happens in a paste, inside HTTPS, on a personal account. 89% of enterprise AI usage generates no logs at all.

Governance lives in the routing, not on top of it

An orchestrator classifies each task and sends it to the right model. The routing table is your policy, enforced on every request.

TASK IN
"Refactor the auth layer, with tests"

→

ORCHESTRATOR
classifies, decomposes, delegates

→

RIGHT MODEL
reasoner plans, executor builds, reviewer checks

→

VERIFIED DELIVERY
budget and policy enforced per request

SPEND

Hard caps per user, team, API key. Cheap models on bulk work, premium only where it matters.

RESILIENCE

A model gets deprecated or repriced, the role re-routes. No single vendor is a single point of failure.

PERIMETER

Zero model-data egress, enforced before the request leaves. Not audited after.

CONTROL

Humans write the routing table. The system applies it and reports what went where, per phase.

Kimchi
By CAST AI

Where does your prompt go when you hit Enter?

THE LAW IS TIGHTENING

India's DPDP Act restricts cross-border transfer of personal data. RBI already mandates payment data localization.

THE AI GAP

Every prompt sent to a foreign model endpoint is a cross-border transfer. Most teams can't say where theirs goes.

THE ROUTING ANSWER

Sovereignty becomes a routing rule. Run enforcement in your own cluster. Zero model-data egress.

SOURCE: DPDP Act 2023 (cross-border transfer rules) · RBI payment data localization · kimchi.dev/deployment

> THE BLUNT PART

We built the control plane. It's called Kimchi. It's open source.

Kimchi
By CAST AI

kimi-k3	glm-5.3	glm-5.3-flash	kimi-k3	deepseek-v4-flash
Orchestrator	**Planner**	**Builder**	**Reviewer**	**Explorer**
Runs the loop, classifies every task, delegates work, owns the budget check.	Designs the approach, writes the spec the builders work from.	High-throughput generation. Cheap models on bulk work.	Strongest model on every diff.	Reads the codebase. Light models for scans.

The spend console is the answer to Case 002: hard caps per user, team, API key, real-time attribution per phase. Self-hosting answers Case 001 and the DPDP slide. Model-swappable over an OpenAI-compatible API is the answer to lock-in.

Cloud computing already lived this.

Tokens are just earlier on the same curve.

Cloud fixed this with tags on every resource. AI needs tags on every request.

SOURCE: AWS cost allocation docs · FinOps Foundation

Kimchi By CAST AI

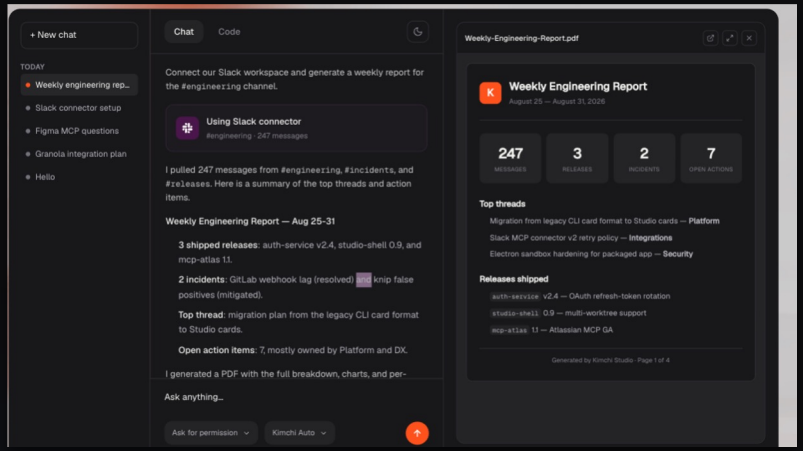

Every request tagged. Every rupee attributed.

BUDGETS
Hard caps per user, team and API key

USAGE
Requests, tokens and cost, live

PRODUCTIVITY
Sessions, PRs and commits per team

TAGS
Attributed at request time, not after

Kimchi Studio: adoption, usage, budgets, productivity in one console.

SOURCE: docs.kimchi.dev · Reporting: budgets, usage, productivity, analytics, adoption, tags

> UNATTENDED WORK

Kimchi
By CAST AI

Close the laptop. The governance stays on.

REMOTE WORKSPACES

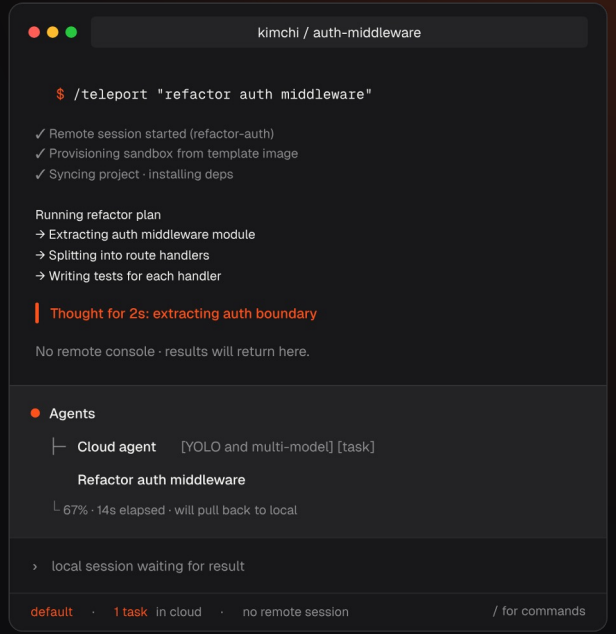

- ✓ /teleport hands your session to a cloud workspace
- ✓ Plans keep running after you disconnect
- ✓ Reconnect from CLI, console or VS Code

THE GOVERNANCE PART

- ✓ Same routing and budgets on remote runs
- ✓ Parent session id survives the handoff

kimchi — remote-sessions

```
$ kimchi /remote-sessions
> /teleport · session handed off
> laptop closed 18:40 · agent still building
✓ budget enforced · parent id kept
```

SOURCE: docs.kimchi.dev · Remote Workspaces (/teleport, remote execution, session attribution)

> THE RECEIPT

Watch it route

$ kimchi

✓ multi-model (kimi-k3) · ctrl+p to inspect routing

> add pagination to /users, write tests, update the OpenAPI spec

↳ explore deepseek-v4-flash · reading routes, tracing imports

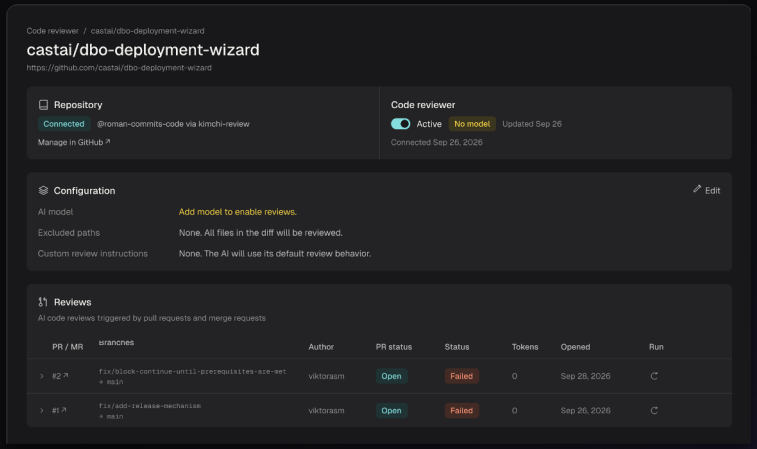

↳ plan glm-5.3 · spec: cursor params, edge cases, test matrix

↳ build glm-5.3-flash · handler + tests + spec edits

↳ review kimi-k3 · diff checked, 2 fixes routed back

✓ ready: 4 files changed · spend attributed per phase · diff on your branch

Every phase tag is a routing decision with a price and a policy behind it. This is the audit trail Samsung never had.

The reviewer role: a strong model checks every diff before it reaches you.

Kimchi
By CAST AI

What routing doesn't solve

01

EVALUATION

Evaluation still needs humans. Routing sends review to a strong model. Deciding if the review was right is still your job.

02

SPEC QUALITY

A bad spec routes perfectly. Garbage in, efficiently delegated, garbage out, on budget. Spec quality is upstream of any control plane.

03

PAST LEAKS

The Samsung leak already happened. Routing prevents the next one. It does not retrieve the last one.

Routing is the control plane, not the whole answer.

Kimchi
By CAST AI

You cannot predict AI.

You can make every decision about it yours.

START MONDAY

1 Route one real workflow

2 Read the routing table

3 Set one hard cap

kimchi.dev · github.com/getkimchi/kimchi · Kunal Das, Cast AI

Open source. OpenAI-compatible. Governed by default.
